

## EXECUTIVE SUMMARY

### Instructor Performance and Course Quality Evaluation on EduPro

Prepared by: Pawan Kumar Lakhera | June 2026 | Unified Mentor

#### Purpose

This report presents the key findings and recommendations from a data analytics project conducted for EduPro, an online learning platform offering courses across multiple domains. The objective of this project was to evaluate instructor performance and course quality using learner ratings, enrollment data, and instructor experience metrics, and to provide data-driven recommendations that can help EduPro improve instructional standards, enhance learner satisfaction, and strengthen its competitive position in the online education market.

#### Key Findings

- **Instructor quality directly drives course quality.** The average Teacher Rating (3.13) and average Course Rating (3.10) are nearly identical, confirming that instructor effectiveness is the single strongest determinant of learner satisfaction on the platform.
- **A significant performance gap exists across instructors.** Teacher ratings range from a low of 1.07 to a high of 4.97 — a gap of 3.90 points — indicating substantial variation in instructional quality that is directly impacting learner experience across the platform.
- **Three instructors are critically underperforming** with ratings below 2.0, while six instructors consistently maintain ratings above 3.5, demonstrating that high-quality teaching is achievable but unevenly distributed.
- **Data Science is the most popular course category** with 916 enrolled learners, followed by Finance (864) and Web Development (844), reflecting strong learner demand for technology and career-oriented skills.
- **Marketing, Machine Learning, and Programming are the top-performing expertise areas**, with average ratings of 4.3, 4.2, and 4.0 respectively — all significantly above the platform average of 3.13.
- **Design and Web Development are the weakest expertise areas**, with average ratings of 2.3 and 2.5 respectively, indicating a need for immediate curriculum and instructor quality improvement in these domains.
- **Free courses perform competitively with paid courses.** Free Beginner and Intermediate courses outperform their paid counterparts in learner ratings, demonstrating that content quality — not pricing — is the primary driver of learner satisfaction on the platform.
- **Experienced instructors consistently receive higher ratings.** The highest observed teacher rating (4.97) belongs to an instructor with over 20 years of

experience, and ratings above 4.0 are predominantly found among instructors with 8 or more years of experience.

## Business Impact

The findings indicate that EduPro's overall platform quality is being held back by a minority of underperforming instructors and a small number of weak course categories. At the same time, the platform has a proven group of high-performing instructors whose teaching practices, if replicated across the network, could meaningfully raise overall learner satisfaction. The strong demand for Data Science, Finance, and Web Development courses — combined with the underperformance of Web Development as a category — represents both a risk and an immediate opportunity for the platform to improve quality where learner demand is highest.

## Recommendations

- **Implement a structured instructor improvement programme** for all instructors with ratings below 2.0, including peer mentoring from top-rated instructors, teaching workshops, and mandatory student feedback reviews.
- **Replicate the teaching practices of top-rated instructors** — particularly Yolanda Levine (5.0), Kimberly Miller (4.6), and Aaron Kirby (4.3) — by documenting their methods and incorporating them into a platform-wide faculty excellence programme.
- **Prioritise quality improvement in Design and Web Development**, where average ratings fall significantly below the platform benchmark. Course content, delivery methods, and instructor assignments in these categories should be reviewed immediately.
- **Expand course offerings in high-performing, high-demand categories** — specifically Marketing, Machine Learning, and Cybersecurity — where learner satisfaction is consistently strong.
- **Introduce a minimum rating threshold** for active instructor status on the platform, ensuring that instructors who fall below an acceptable standard are supported through improvement programmes before continuing to teach.
- **Leverage free courses as a learner acquisition strategy**, given their competitive performance against paid offerings, while creating structured learning pathways from free Beginner content through to paid Advanced programmes to drive platform revenue growth.

## Conclusion

The analysis demonstrates that EduPro has a strong foundation of high-performing instructors and high-demand course categories to build upon. However, the significant variation in instructor quality across the platform represents a reputational and commercial risk that must be addressed through structured quality management. By investing in

instructor development, replicating proven teaching excellence, and improving underperforming course categories, EduPro can meaningfully raise overall learner satisfaction, strengthen its market position, and support the growing demand for high-quality online education.
